Problem 1.

Solution. The output y is given by

$$y(n) = \phi(w_{O1}y_1(n) + w_{O2}y_2(n)) \quad (1)$$

where

$$y_1(n) = \phi(x_1w_{11} + x_2w_{12} + y_1(n-1)w''_{11} + y_2(n)w'_{12}) \quad (2)$$

$$y_2(n) = \phi(x_1w_{21} + x_2w_{22} + y_2(n-1)w''_{22} + y_1(n)w'_{21}) \quad (3)$$

■

Problem 2.

Figure 1: (a) overlapping of convex hulls A and B. (b) linearly separable convex hulls

Solution. (a) From Figure 1(a) we see that the two convex hulls are intersecting. Assume that there exist vectors \bar{w} and \bar{b} such that $\bar{w}^T\bar{x}_n + \bar{b} > 0$ for all $\bar{x}_n \in A$ and $\bar{w}^T\bar{z}_n + \bar{b} < 0$ for all $\bar{z}_n \in B$. We know that $A \cap B \neq \phi$ implies there exist at least one element $\bar{y} \in A \cap B$. We can write $\bar{y} = \sum_{n=1}^{N_x} \alpha_n \bar{x}_n$ and $\bar{y} = \sum_{m=1}^{N_z} \beta_m \bar{z}_m$ for some α and β satisfying the conditions as mentioned in the question. We look at $\bar{w}^T\bar{y}$ which is given by

$$\bar{y} = \begin{cases} \sum_{n=1}^{N_x} \alpha_n \bar{w}^T \bar{x}_n + \bar{b} > 0, & \text{for all } \bar{x}_n \in A \\ \sum_{n=1}^{N_x} \alpha_n \bar{w}^T \bar{z}_n + \bar{b} < 0, & \text{for all } \bar{z}_n \in B \end{cases} \quad (4)$$

From equation (4), we see that it is contradicting the assumption of existence of vectors \bar{w} and \bar{b} .

- (b) From Figure 1(b) we see that \exists vectors \bar{w}^T, \bar{b} such that $\bar{w}^T \bar{x}_n + \bar{b} > 0$ for all $\bar{x}_n \in A$ and $\bar{w}^T \bar{z}_n + \bar{b} < 0$ for all $\bar{z}_n \in B$. Now, we have to show $A \cap B = \phi$. We know that existence of \bar{w} and \bar{b} guarantees $\bar{x} = \sum_{n=1}^{N_x} \alpha_n \bar{x}_n \notin B$ and $\bar{z} = \sum_{m=1}^{N_z} \beta_m \bar{z}_m \notin A$ implying $A \cap B = \phi$. ■

Problem 3.

Solution. (a) Let \bar{x} be the input with true class \mathcal{C}_k . The total expected loss with $L_{kk} = 0$ for $k = 1, \dots, N$ is given by

$$\mathbb{E}(L) = \sum_{k=1}^N \sum_{j=1}^N \int_{\mathcal{C}_j} L_{kj} P(\bar{x} \in \mathcal{C}_k | \bar{x}) P(\bar{x}) d\bar{x}. \tag{5}$$

Equation (5)

- (b) The optimal rule for assigning class labels

$$j^* = \min_j \left(\sum_{k=1}^N \int_{\mathcal{C}_j} L_{kj} P(\bar{x} \in \mathcal{C}_k | \bar{x}) P(\bar{x}) d\bar{x} \right) \tag{6}$$
■

Problem 4.

Solution. (a) The figure 2 shows the decision boundary for the **AND** and **OR** operations.

Figure 2

- (b) We know that the output of the **XOR** operation forms a non-linearly separable class as shown in Figure 3. Therefore, it is not possible to separate the two classes using perceptron. ■

Figure 3: The two classes are non-linearly separable.

Figure 4: Full moon and crescent moon shapes with $R_m = 5$, $R_{in} = 10$, $R_{out} = 15$, and $D = 0$.

Problem 5.

Solution. (a) The required data points are generated as shown in Figure 4

- (b) The value of D is varied from 0 to 7 and the resulting perceptron decision boundary is shown in Figures 5a-5h.
- (c) With $D = 7$, five different initial weight vectors were chosen and the resulting perceptron decision boundary is shown in Figures 6a-6e. The decision boundaries were different with different initial conditions.
- (d) With $D = 7$, the sequence in which the input is presented is randomized and the resulting perceptron decision boundary is shown in Figures 7a-7e. We do not observe any significant difference in the decision boundaries.
- (e) A Gaussian noise with mean 0 and standard deviation ranging from 1 to 3.1 is added to the dataset generated as shown in Figure 4 and the resulting perceptron decision boundary is shown in Figures 8a-8d. The stopping criterion is error threshold set to 10^{-6} . The linear classification is not possible with the increase in standard deviation.
- (f) The initial learning rate is varied from 0.1 to 1 in steps of 0.1. The initial weight vector was set to $[0, 0]^T$. The error threshold as stopping criterion is set to 10^{-6} . The number

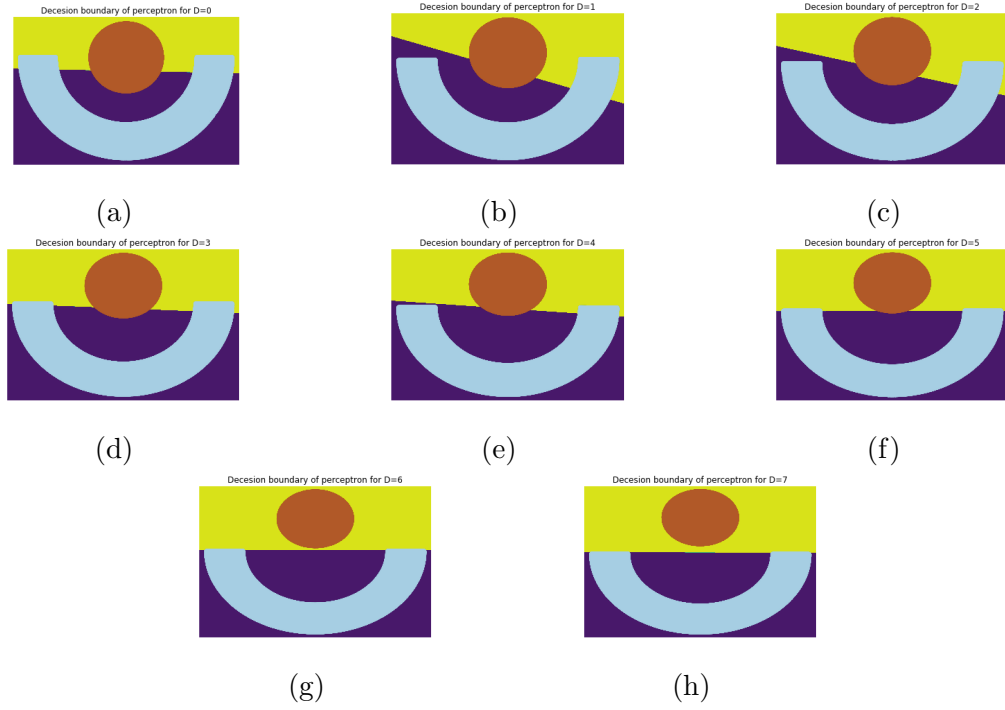

Figure 5

of epochs required for convergence is 3 for all initial learning rates. This indicates that the convergence is independent of the learning rate. ■
